

The Heatwave High Voltage Heating Kit is an innovative, underfloor heating system, that is ideally suited for new construction or remodeling. Heatwave is designed to be installed in thinset directly under your floor. The heating element and fabric mesh mat adds less than 1/4" of height to the floor.

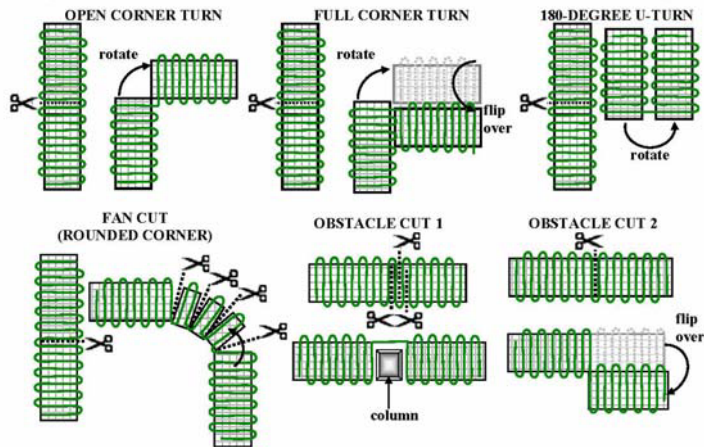

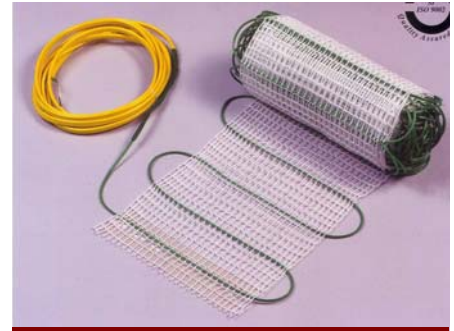

QUALITY

The Heatwave Heating Kit comes in a variety of lengths and widths, providing many configurations to heat up to 75 square feet. The kit includes the specified amount of heating element, 13 feet of cold lead, and a 7-day 24-hour programmable thermostat with an infloor sensor. Heatwave has a 10 year warranty and is UL Listed.

TOTAL COMFORT

Perfect for bathrooms, kitchens, or other small areas, the Heatwave Heating Kit is installed directly under tile or other floor coverings. Its close proximity to the floor surface means that your floor reaches the desired temperature quickly.

VERSATILITY

The Heatwave Heating Kit is extremely versatile, because the fabric mesh between the heating elements can be trimmed and cut to change directions, turn corners, or avoid obstacles. The fabric mesh attaches to the subfloor using a double sided tape that is pre-installed into the mat, making it one of the easiest systems to install on the market.
